Naming Conventions within Claravine

A naming convention is a data standard defining a structured way to associate additional attributes about components of a digital marketing campaign in what is an ordinary free text field (e.g. campaign name).

Why use a naming convention?

- **Campaign Performance & Analysis** – Split names apart into separate categorical fields to answer more questions in campaign performance reporting. (e.g. 'What type of placements performed best?')
- **User Productivity** – Organize information in ad platforms through a common format allowing users to quickly search, browse, and identify components of marketing campaigns. (e.g. ad ops specialist searching Google Ads for all top of funnel, or 'TOF', campaigns)

Ex.

TOF-Display-Awareness-EMEA

Short Code	Funnel Stage
TOF	→ Top
MOF	→ Middle
BOF	→ Bottom

Once split apart, short codes are used to lookup human-friendly values in lookup tables

Audit & Validate the Process

Convert Short Codes

Access to Human Readable Reporting

Convert Short Codes

Current state

Teams get creative and use abbreviations or codes to create shortened naming conventions. Analytics solutions struggle to decode and translate the metadata

Transform Data

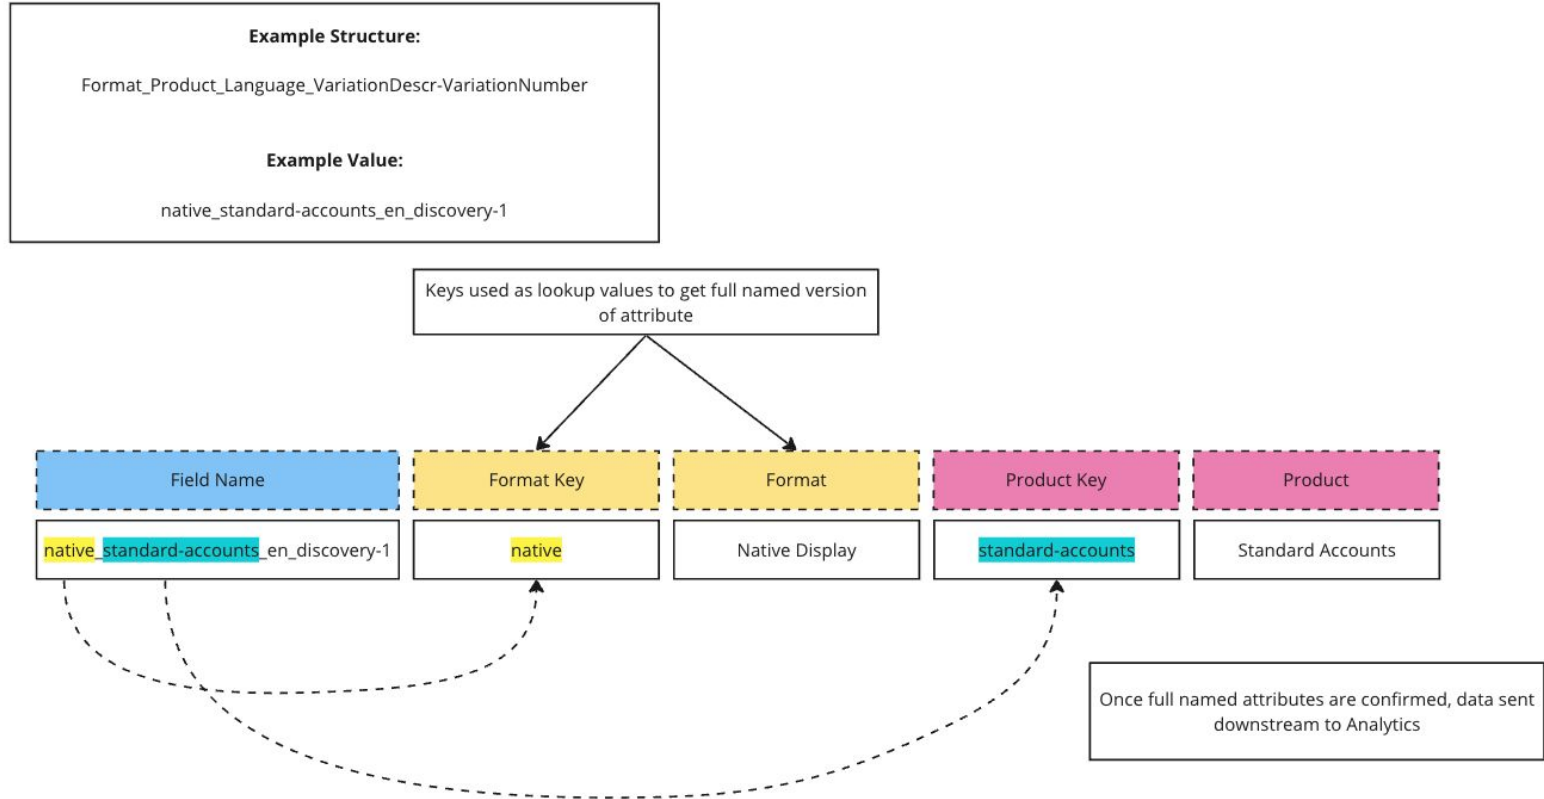

- Drill down lists & drop downs allow for enriched data
- Split and extract out multiple layers of taxonomies
- Increased dimensional data without long campaign strings

Splitting text setup & configuration options

Automation

Connected Metadata via
Integrations

Powering Lists with Specific Values

Current state

Error prone reports stem from teams reliance on copy & paste to share campaign names and metadata.

Transform Data

- Parse out a specific element within a campaign name
- Save extracted elements to a **powered list**
- Auto-populating metadata for the next team to select from

Transform

Convert Case: None | Spaces: None

Extract Data: Split and Extract on Delimiter

Extract Data From: Source Field

Delimiter*: _ (underscore) | Position: 3
